- Introduction
- Motivation
- Principle
- Setup
- Requirements
- Advantages
- Drawbacks
- Applications
- Conclusion

- Objective
 - To investigate effectiveness of 'electric tempest in a teacup' method for microfluidic separation in microgravity
- Team
 - 5 SpaceMaster students at LTU, Kiruna: Mark Fittock, Samuel Webster, Martin Siegl, Fan Chunman, Pooja Mahapatra

10 Oct 2008

SPW, ESA/ESTEC

3

- Einstein's tea leaves: circular stirring in a teacup
 - Friction at cup base
 - Reduction in centrifugal force towards cup bottom

10 Oct 2008

SPW, ESA/ESTEC

4

- Efficient separation difficult in microfluidic devices
- Some methods:
 - Strong centrifugation: difficult to achieve in nanoscale, cumbersome machinery
 - Microfabricated filters: complex membranes and fabrication techniques, deformation and denaturing of cells in case of blood
 - Dielectrophoresis (DEP): ineffective below $10\mu\text{m}$ particle diameter

10 Oct 2008

SPW, ESA/ESTEC

5

- Ionic wind
 - $V >$ threshold air ionization voltage
 - Corona discharge around sharp electrode tip
 - Plasma counterions collide with electroneutral air molecules, transfer momentum

10 Oct 2008

SPW, ESA/ESTEC

6

- Orientation effects

$\varnothing$ = angle between probe and fluid surface

SPW, ESA/ESTEC

7

10 Oct 2008

SPW, ESA/ESTEC

8

- Microfluidic chamber (8 mm diameter, 4 mm depth)
- Separation medium: Diluted sheep's blood (enables easy visualization)
- ~3 min microgravity time, 1 bar pressure and 23 ° C to be maintained in rocket chamber
- High voltage supply and sharp probe
- On-board image acquisition and data storage hardware

10 Oct 2008

SPW, ESA/ESTEC

9

- No mechanically moving parts
- Small sample size
- No electrode-sample contact: mechanical failure, sample contamination prevented
- Little field penetration into fluid: no adverse effects on biomolecules
- Minimal current, low power
- Particle aggregates undisturbed after removal of electric field
- Miniaturization possible: piggybacking for rocket launch

10 Oct 2008

SPW, ESA/ESTEC

10

- Risk due to high voltage: adequate safety precautions necessary while implementing and testing
- High cost
- Piggybacking, hence no data transfer back to ground: post-launch experiment recovery is crucial

10 Oct 2008

SPW, ESA/ESTEC

11

- Miniature, low-power **replacement for centrifuge** (for experiments in physics, biology, materials)
- Portable medical **diagnostic kits** for astronauts, especially in long-duration spaceflights
- **Microarray chips** in high-throughput drug screening

10 Oct 2008

SPW, ESA/ESTEC

12

- Ion-jet induced vortex separation holds promise for miniature implementation on board spacecraft
- The project is currently in the design phase
- Launch options are being explored
- After implementation, rigorous ground testing is important to validate results of microgravity experiment
