

Jupiter Magnetosphere and Moons Plasma (JuMMP) Investigation for EJSM

D. O. Kataria and the JuMMP consortium

A. J. Coates (PI), G. H. Jones, C. S. Arridge, D. O. Kataria,

A. N. Fazakerley, C. J. Owen, G. Branduardi-Raymont, B. K. Hancock

Mullard Space Science Laboratory, University College London, Holmbury St Mary, Dorking RH5 6NT, UK

D. J. McComas (co-PI), D. T. Young, F. J. Crary, M. I. Desai, S. Bolton

Southwest Research Institute, San Antonio, Texas, USA

S. Selci (CNR/ISC, Rome, Italy), R. Leoni (CNR/IFN, Rome, Italy), A. M. Di Lellis (AMDL, Italy)

F. Bagenal (University of Colorado, USA), R. E. Johnson (University of Virginia, USA)

S. Miller, N. Achilleos (Department of Physics & Astronomy, University College London, UK)

S. W. H. Cowley, E. J. Bunce (University of Leicester, UK) J. Saur (Universitaet zu Koeln, Germany)

Summary of JuMMP science objectives - 1

Jupiter magnetosphere

- Identify the sources and sinks of plasma using energy spectra, charge state and elemental composition.
- Characterise the physics of acceleration, transport and escape of plasma from the magnetosphere.
- Characterise Jupiter's magnetodisc
- Determine the global configuration and dynamics plasma populations in the jovian magnetosphere.
- Identify the role of processes such as reconnection

Summary of JuMMP science objectives - 1

Moon interactions

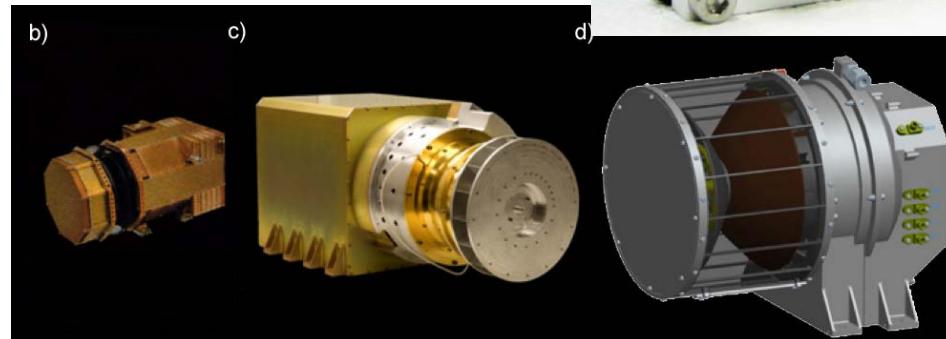

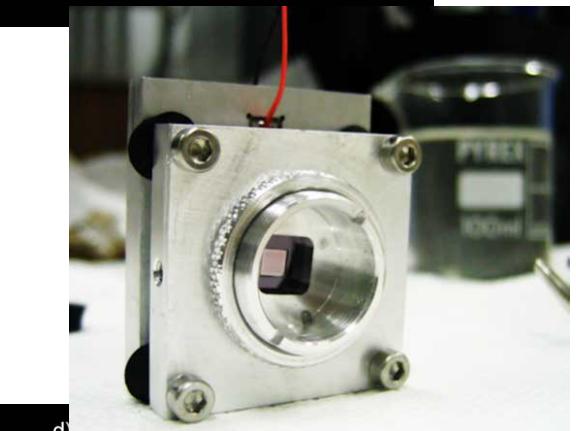

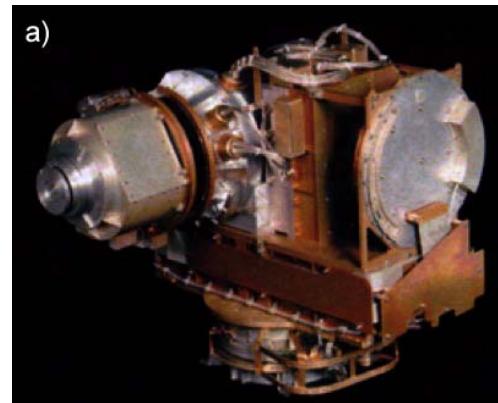

- Determine the magnetosphere-satellite interactions using measurements of ions, electrons and neutrals.
- Investigate the absorption of energetic ions by Ganymede
- Identify the ions in, and escaping from, Ganymede's ionosphere
- Study the modification of Ganymede's surface and atmosphere through ion bombardment.
- Study similar processes at Callisto (JGO flybys) and Europa (JuMMP-JEO)

JuMMP Baseline Instruments – JGO & JEO

- JENI
 - Jupiter Electron and Negative Ion Sensor
- JIMS
 - Jupiter Ion Mass Spectrometer
- LENA
 - Laplace-Energetic Neutral Atoms
- AMMICE
 - Advanced Mass and Ionic Charge Composition Experiment

Heritage

- Outer Planets
 - CAPS on Cassini, PEPE on DS1
 - LENA on Bepi Colombo, Image, Twins
 - SWAP on New Horizons
- Radiation mitigation
 - JADE-I on JUNO
 - Double Star PEACE
- Planetary protection
 - ExoMars Pancam
- Composition
 - CAPS
 - PEPE
 - HPCA on MMS

Technology development activities - 1

- JENI implementation – STFC funded
 - Instrument design and optimisation study
 - Micro-fabricated instrument development
- JIMS and AMMICE – US funded
 - Instrument design and optimisation study
 - AMMICE implementation
- LENA implementation – Italian Space Agency

Technology development activities - 2

- Instrument development studies
 - Design optimisation, accommodation, resource
- Radiation mitigation
 - Radiation shielding
 - Requirements
 - Impact on mass and power
 - Impact on Instrument performance and data returned
- Spacecraft and environment effects impact
- Common Electronics development
 - Radiation shielding
 - Instrument resources optimisation

Miniaturised Plasma Analyser

EJSM challenges

- Radiation hardness
- Background environment
- Instrument resources
- Instrument accommodation
 - Common electronics
 - Field-of-view
- JEO is particular challenge

Miniaturised Plasma Analyser

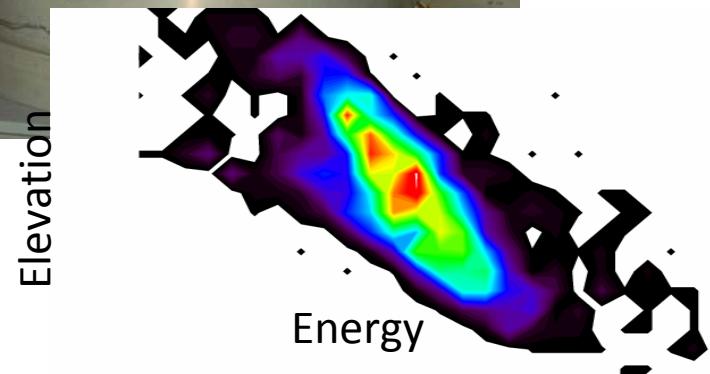

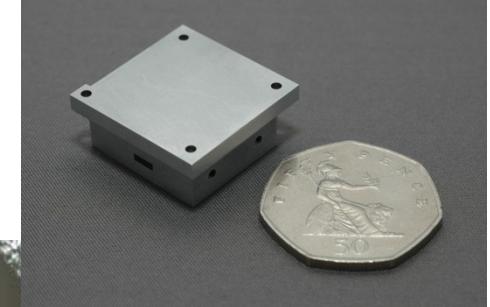

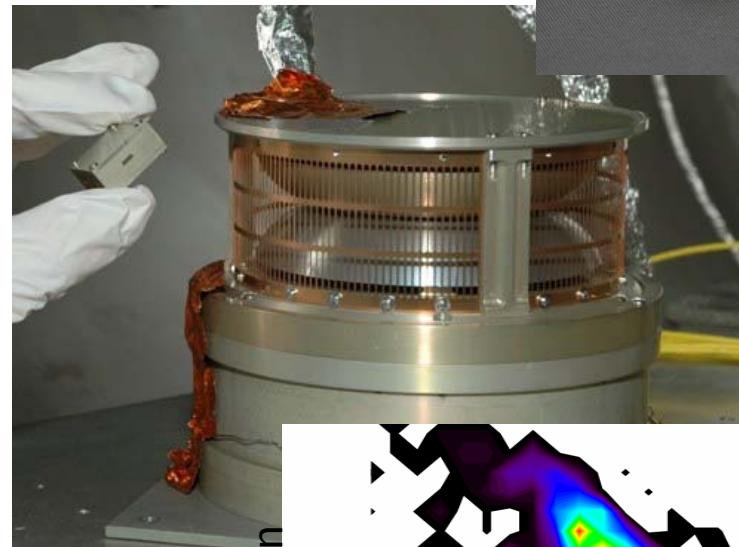

Advantages

- More analysers – fov, speed, sensitivity
- Flexibility with instrument accommodation
- Radiation and background mitigation
 - Small detector x-section
 - Anti-coincidence techniques for background mitigation
 - Reduced shielding mass
- Low resource – mass, power, cost

Miniaturised Plasma Analyser

Proof-of-concept analyser

- Currently under Test
- Instrument Analyser Concept
 - TRL 4
- Full prototype – mid 2010
- Estimated resources:
 - < 300 gms, 5 cm dia
 - Low shielding mass
- Miniaturised rad hard electronics next focus

Summary

- Strong team with strong heritage
- Interest in both JGO and JEO
- Team meeting last week
- Studies underway
 - Science requirements
 - Instrument TDAs
 - Radiation mitigation studies
 - Systems Engineering
