

Atomic Quantum Sensors and Fundamental Tests

C. Salomon

Laboratoire Kastler Brossel, Ecole Normale Supérieure, Paris

ESA- ESTEC-FPRAT, January 21th, 2010

Fundamental Questions

1) Missing mass in the Universe

Dark matter and dark energy represent 95% of the mass of the Universe but have unknown origin !

New particles and/or change of the laws of gravity ?

2) Atomic Sensors can test fundamental laws with exquisite precision

Einstein's equivalence principle and Universality of Free Fall

Tests of gravity in Earth orbit or at solar system scale

Precision redshift measurement

Variability of fundamental constants

3) Quantum sensors have societal applications

Accelerometry, Gravimetry, Navigation, GPS, GALILEO, Geodesy, Earth monitoring,...

Atom Interferometry

Matter wave interferometry: as old as Quantum Mechanics
Cold atoms: new opportunities with large De Broglie wavelength

Change of optical path-length...

 Change of phase of interference pattern

Atom interferometry

 Atomic source
 Beam splitters
 detectors

Atom interferometers and Clocks

Atoms have internal states

Two level atom: g, e

Laser resonant on g, e transition

Neglect spontaneous emission

Use long lived upper states

Mg, Ca, Sr, Yb, ...

or

Raman Transition between hyperfine ground states in alkalis for instance

Effective two-level system

a)

b)

Matter-wave sensors and precision measurements

Clocks and Interferometers

T : interaction time with ELM field
Slow atoms: T large; atomic fountain
or microgravity

Trapped atoms: T large
Clocks: gain prop. To T

Inertial sensors:

Accelerometers: gain as T^2

Sagnac gyrometers: gain as $L T$

Current sensitivity:

Acceleration: $\delta g/g = 1.4 \cdot 10^{-8}$ in 1 s

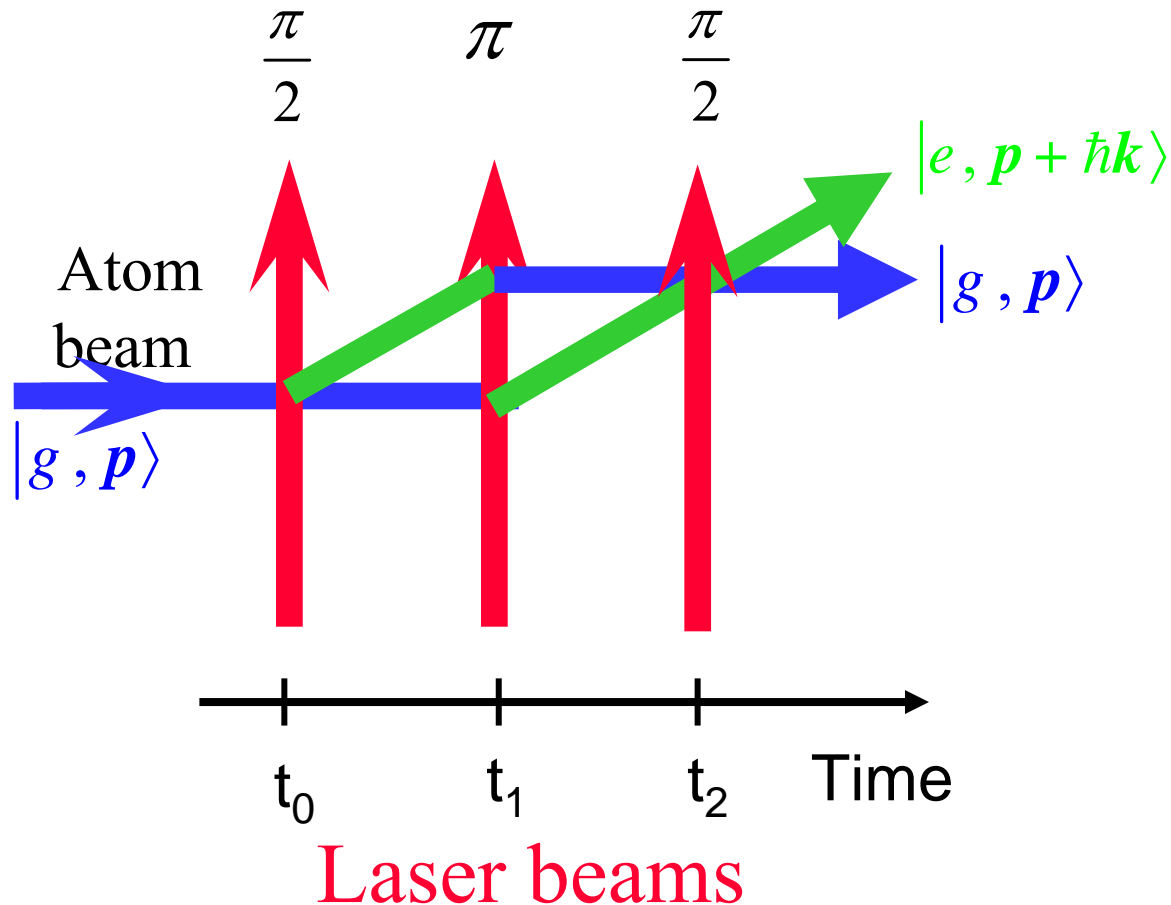

Rotation: $\Omega = 6 \cdot 10^{-10}$ rad s⁻¹ in 1 s

Clocks:

Frequency stability: $\delta \nu/\nu = 2 \cdot 10^{-15}$ in 1 s

Accuracy: $= 8.6 \cdot 10^{-18}$

Mach-Zehnder interferometer with light beams

$$\delta\phi = \phi_1(t_0) - 2\phi_2(t_1) + \phi_3(t_2)$$

Sensitive to rotation and accelerations: gyrometers and gravimeters

Cold atom gravimeter

S. Chu
A. Peters et al.
Stanford

$$\delta\phi = -k_{eff} a T^2 = -k_{eff} g T^2 = -2k_L g T^2$$

Ground sensitivity: $\sigma_g \sim 10^{-7} \text{ m.s}^{-2}$ at 1 s

with interrogation time 100 ms

limited by vibrations

Extrapolation to space: $< 10^{-10} \text{ m.s}^{-2}$ at 1 s

with interrogation time 2 s

With ultra-cold atoms: $\sim 10^{-11} \text{ m.s}^{-2}$ at 1 s

with interrogation time 10 s

Earthquake in China 2 Mars 20th 2008 (magnitude 7,7)

A. Landragin
F. Pereira
SYRTE

BEC in microgravity: QUANTUS

Coordinator E. Rasel

Exploring coherent matter waves at lowest energy scales, in particular for

... Precision inertial sensing

... Quantum test of the principle of equivalence beyond 1 part in 10^{15}

QUANTUS

Achievements:

- > 170 drops
- Robust alignment
- 3 drops per day
- High complexity
- Study of Evolution & control of condensates

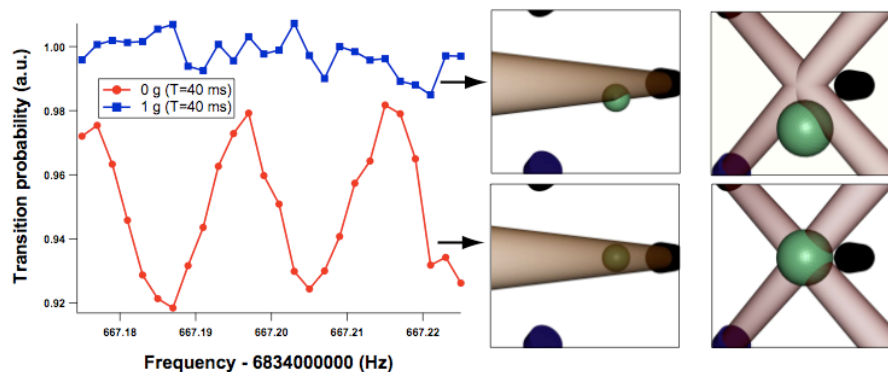

Goals:

- Test of chip-based and all-optical atom lasers for precision inertial sensing
- Atom interferometry
coherent matter waves
- Test of free fall of isotopes of potassium and rubidium

ICE: Atom accelerometer in microgravity

Coordinator P. Bouyer

- Operation of atom interferometer in the 0g airbus.
- Demonstration of atom accelerometer in weightlessness.
- Demonstrated background vibration suppression by correlation measurement of atom & classical accelerometer.

2 species atom interferometer : test of the equivalence principle @ 10^{-11} in the plane and 10^{-13} on ISS.

SAI - Space Atom Interferometer

Coordinator: Guglielmo M. Tino

SAI accelerometer

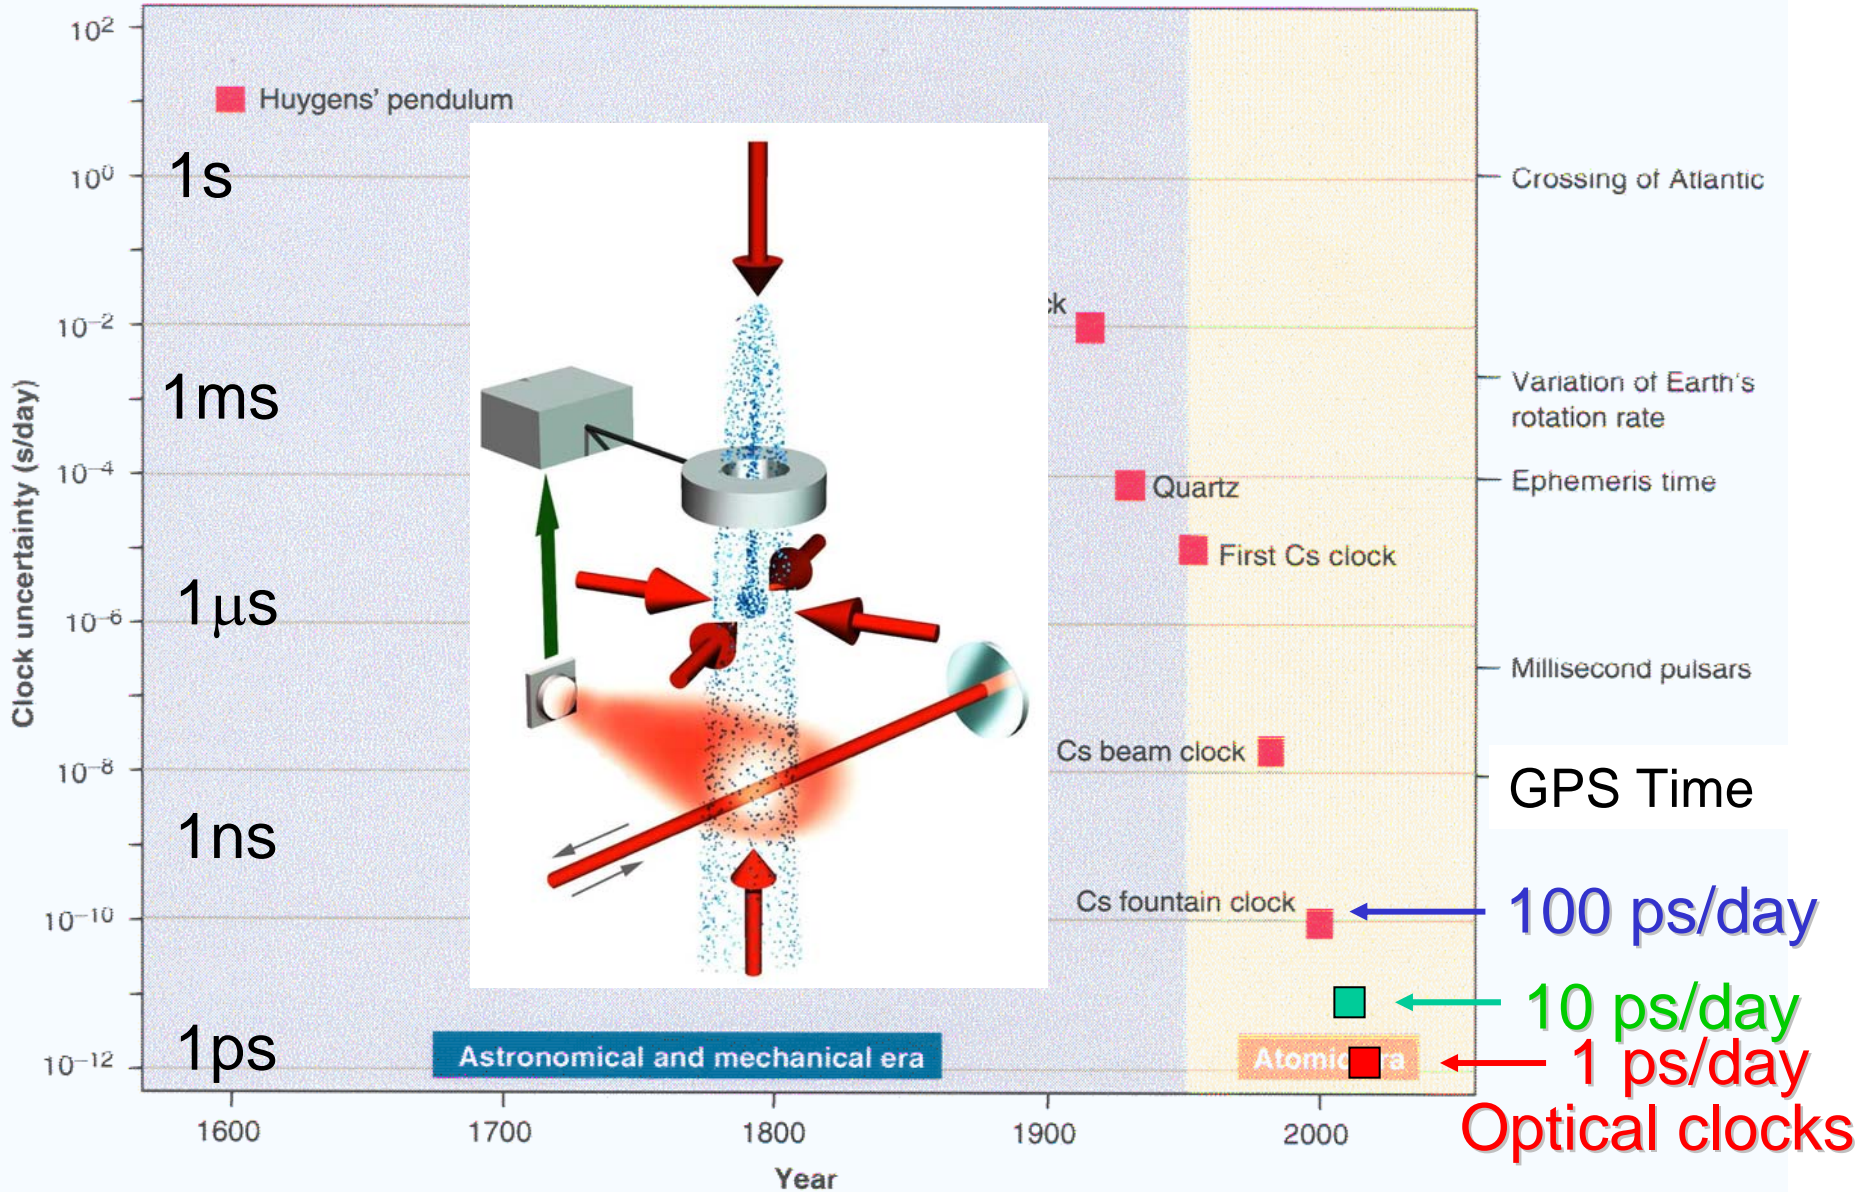

- Main goal: compactness/portability -> to fit into a drop-tower capsule
- Use same cell for trapping and detection (launch in 1-1-1 config.)
- HUB design for titanium vacuum cell
- Load 3D-MOT from 2D-MOT
- Magnetic shield on whole vacuum system
- Launch into a 20 cm tube
- Single axis Raman accelerometer
- sensitivity spec $3 \cdot 10^{-7} \text{ m/s}^2 @ 1 \text{ s}$

Quantum sensors (2)

Cold Atom Clocks

Precision of Time

In Space: Cold Atom Clock in μ -gravity : PHARAO/ACES

20.054 kg, 36W

Total volume: 990x336x444 mm³
Mass: 44 kg

Same Technology can be applied to matter wave sensors

ACES
atomic
clocks

To be launched to ISS
in 2013

- A cold atom Cesium clock in space
- Fundamental physics tests
- Worldwide access

Trapped-atom clock on a chip

$$\left. \begin{array}{l} F = 2, m_F = +1 \\ F = 1, m_F = -1 \end{array} \right\}$$

experience
same trapping
potential (same
magnetic moment)

$N \sim 3 \cdot 10^4$ atoms

$T \sim 200$ nK

$d \sim 150 \mu\text{m}$ atom-surface distance

result: $\tau \sim 17$ s coherence lifetime

P. Rosenbusch, J. Reichel, SYRTE-ENS, 2009

2 Families of Optical Clocks: Trapped Ions and Neutral Atoms

- Quality of the clock: $\nu/\Delta\nu \times S/N = 2 \nu T \times S/N$
- Increase the frequency, increase T , increase S/N
- Trapped ions : T very long but only one (few) ion in the trap.
- Neutral atoms: T long and large numbers: improved stability

NIST : Rosenband et al.

- Al^+ : optical transition
- Accuracy: $8.6 \cdot 10^{-18}$

*A factor of 30 beyond
the cesium accuracy !*

- Neutrals: Ca, Sr, Yb, Mg, Hg,...
- Sr: 10^{-16} accuracy, Ye et al.
- TOKYO, JILA, SYRTE, PTB, FLORENCE,.....

Coordinator S. Schiller, Duesseldorf

Goal: develop optical lattice clocks with inaccuracy at 10^{-17} level for space applications, in particular on ISS. Two approaches: Strontium and Ytterbium

Pre-Phase A project (2007-10) : 1×10^{-16} on Sr clocks, development of compact subsystem.

Current status on stationary Sr clocks: Study of systematic effects at 10^{-16} level, Frequency instability $< 1 \times 10^{-15}$, transition linewidth 9 Hz, non-destructive detection

Transportable Yb clock system

all-diode laser based. Current status: routine operation of 2nd stage cooling, 2 Hz linewidth clock laser

Sr breadboard with modular subsystems and all-fiber light delivery. Current status: atomic beam production; transp. Sr clock laser with < 10 Hz linewidth

Space Optical Clocks (Phase 2, 2010-14)

- **Goal:** Building on SOC-I results, develop transportable/breadboard lattice clocks with 5×10^{-17} inaccuracy, $< 1 \times 10^{-15} / \tau^{1/2}$ instability (Sr, Yb)
- 2nd generation breadboard Sr atomic and electrooptics system: < 170 kg, 1000 liter.
- Modular systems
- Develop reliable, compact and rugged lasers and subsystems
- Advanced atomic chambers, optimized w.r.t. size, black-body shift
- Transport and characterization of clocks at national metrology labs (PTB, INRIM)
- Laser diode reliability tests; compact frequency comb development
- 16 partners

Future Time Definition from Space

- 1) The Earth gravitational potential fluctuations will limit the precision of time on the ground at 10^{-18} - 10^{-19} (ie: cm to mm level)
- 2) The only Solution: set the reference clocks in space where potential fluctuations are vastly reduced
- 3) Improved Navigation, Earth Monitoring and Geodesy
- 4) Interesting for fundamental physics Tests

Mission opportunities with clocks

General Relativity test improvement wrt GPA

35

350

40000

10^5

PHARAO: 1×10^{-16} inaccuracy; $1 \times 10^{-13}/t^{1/2}$ instab.
Optical clock: 10 x in accuracy, 100 x more stable

Redshift test at Mercury
with 5×10^{-10} inaccuracy

second-order grav. red-shift
+ Shapiro time delay @ 10^{-8}

Cost,
complexity

The SAGAS Project

test of gravity at solar system scale

arXiv: 0711.0304, (2008);
Exp. Astr. **23**, 651, (2009)
peter.wolf@obspm.fr

*test body trajectory + light trajectory + proper time
= Measures all aspects of gravity !*

Summary

Matter-wave interferometers and cold atom clocks have entered into high precision measurement phase

Technology has progressed fast with routinely working instruments

Fine structure constant @ $3 \cdot 10^{-9}$

Clocks reach stabilities and accuracies in the sub 10^{-17} range

Impressive efforts for miniaturization and reliability

Compact laser sources and atom chips

quantum gases sources: BEC in microgravity and atom lasers

Beyond ACES on the ISS (2013-2015)

Optical Clocks with 10^{-17} frequency stability in 2019 on the ISS or satellite

Test of Equivalence Principle in Space with quantum objects beyond 10^{-15}

Precise accelerometry demonstration

High precision clocks can bring tests of the laws of gravitation

to a new level of precision

Coordinated action between ESA directorates is important !
